Amdt. Dated: May 9, 2008

Response to Office Action dated January 7, 2008

Amendments to the Claims

1. (Original) A semiconductor device with a conductive element and a current sensor,

wherein the current sensor is a magnetic current sensing device for sensing direct,

varying or alternating current flowing through the conductive element, the current

sensing device being integrated in the semiconductor device and being galvanically

isolated from the conductive element.

2. (Original) A semiconductor device according to claim 1, suitable for measuring

current with a µA resolution.

3. (Previously Presented) A semiconductor device according to claim 1, wherein the

current sensing device comprises at least one TMR device.

4. (Original) A semiconductor device according to claim 3, wherein the current

sensing device shares an MTJ stack with an MRAM device.

5. (Original) A semiconductor device according to claim 4, wherein the MTJ stack

comprises:

- an electrically insulating material (103) designed to form a magneto-resistive

tunnelling barrier,

- a pinned magnetic region (105) positioned on one side of the electrically

insulating material (103), the pinned magnetic region(105) having a magnetic moment

vector adjacent the electrically insulating material (103),

- a nearly balanced free magnetic region (220) positioned on an opposite side

of the electrically insulating material (103), the free magnetic region (220) having a

magnetic moment vector (222) adjacent the insulating material (103) and oriented in a

position parallel or anti-parallel to the magnetic moment vector of the pinned

magnetic region (105), the free magnetic region (220) including an artificial anti-

ferromagnetic layer material including N ferromagnetic layers (Fl, F2) which are

antiferromagnetically coupled, where N is an integer greater than or equal to two.

Response to Office Action dated January 7, 2008

6. (Previously Presented) A semiconductor device according to a claim 3, wherein the

current sensing device has a free magnetic layer which has an easy axis oriented to be

substantially perpendicular to a magnetic field caused by current under measurement.

7. (Original) A semiconductor device according to claim 6, the current sensing device

having an easy axis, wherein the easy axis of the free layer is caused by shape

elongation.

8. (Previously Presented) A semiconductor device according to claim 3, wherein the

current sensing device is subjected to an additional magnetic field that can either be

direct, varying or alternating.

9. (Previously Presented) A semiconductor device according to claim 1, the current

sensing device having a pinned magnetic layer with a magnetisation direction and a

free magnetic layer having an easy axis, wherein the magnetization direction of the

pinned magnetic layer is oriented at an angle, with the easy axis of the free magnetic

layer, preferably between 4S0 and 135O, more preferred substantially perpendicular

to the easy axis of the free magnetic layer.

10. (Previously Presented) A semiconductor device according to claim 1, the

semiconductor device comprising adjacent a first side of the current sensing device

(210) a first conductor (90) for conveying a current (I,) to be measured and adjacent a

second side of the current sensing device (210) a second conductor (91) for

conducting current (I₂), the first conductor (90) and the second conductor (91)

crossing but not being electrically connected.

11. (Original) A semiconductor device according to claim 10, the free magnetic layer

of the current sensing device (210) having an easy axis, wherein the first conductor

and the second conductor each include an angle of substantially between 30° and 90°

with respect to the easy axis of the current sensing device.

12. (Original) A semiconductor device according to claim 10, furthermore comprising

a feedback circuit (80) for measuring MR changes on the current sensing device (210)

Response to Office Action dated January 7, 2008

and for controlling current (12) in the second conductor (91) in such a way that no

MR change is observed on the current sensing device (210).

13. (Original) A semiconductor device according to claim 12, wherein the current

feedback circuit has means for generating a feedback signal indicative of the current

(I,) to be measured and conveyed by the first conductor (90).

14. (Previously Presented) A semiconductor device according to claim 10 wherein at

least one of the first conductor (90) and the second conductor (91) comprises at least

one vertical conduction component and at least one horizontal conduction component,

there being a corner between the vertical conduction component and the horizontal

conduction component, thus forming a conductor structure which at least includes an

L-shaped part of which the corner is located adjacent the current sensing device.

15. (Previously Presented) A semiconductor device according to claim 1, furthermore

comprising a flux concentrator (50; 70) to increase the magnetic field at the location

of the current sensing device (210).

16. (Original) A semiconductor device according to claim 15, wherein the flux-

concentrator (50; 70) comprises a dummy MTJ stack which is patterned around at

least one vertical conduction component.

17. (Original) A semiconductor device according to claim 15, wherein the flux-

concentrator (50; 70) is ring-shaped and comprises a gap (51) between poles, the

current sensing device (210) being located in the gap (51).

18. (Previously Presented) A semiconductor device according to claim 1, wherein the

sensor device is compatible with CMOS or MOS processing.

19. (Previously Presented) A semiconductor device according to claim 1, wherein the

semiconductor device is an integrated circuit.

Amdt. Dated: May 9, 2008

Response to Office Action dated January 7, 2008

20. (Original) A semiconductor device according to claim 19, wherein the current

sensor or sensors are arranged to sense quiescent currents (IDDQ) or transient

currents (IDDT).

Claims 21-22 (Cancelled)

Claims 23-28 (Cancelled)

29. (Cancelled)

30. (Previously Presented) A method for manufacturing a semiconductor device

according claim 3, the method comprising providing an MTJ stack.

31. (Original) A method according to claim 30, wherein providing the MTJ stack

comprises depositing a free region.

32. (Original) A method according to claim 31, wherein depositing a free region

comprises depositing an artificial anti-ferromagnetic free region comprising a

plurality of anti-ferromagnetically coupled ferromagnetic layers.

33. (Original) A method according to claim 32, the artificial anti-ferromagnetic free

region having a net magnetic moment which is substantially zero, the method

furthermore comprising modifying the net magnetic moment of the free region so as

to make it nonzero.
